Instruction set architecture - Wikipedia

The collection of machine instructions in main memory is called a machine language program. Machine code or machine language is a set of instructions executed directly by a computer's central processing unit (CPU). Each instruction performs a very specific task, such as a load, a jump, or an ALU operation on a unit of data in a CPU register or memory. Every program directly executed by a CPU is made up of a series of such instructions. The general format of a machine instruction is

In computer programming, machine code, consisting of machine language instructions, is a low-level programming language used to directly control a computer's central processing unit (CPU). Each instruction causes the CPU to perform a very specific task, such as a load, a store, a jump, or an arithmetic logic unit (ALU) operation on one or more units of data in the CPU's registers or memory.

The J instruction has the most space for an immediate value, because addresses are large numbers. J instructions are called in the following way: OP LABEL Where OP is the mnemonic for the particular jump instruction, and LABEL is the target address to jump to. J Format . J instructions have the following machine-code format:

A Turing machine is a mathematical model of computation that defines an abstract machine, which manipulates symbols on a strip of tape according to a table of rules. Despite the model's simplicity, given any computer algorithm, a Turing machine capable of simulating that algorithm's logic can be constructed.. The machine operates on an infinite memory tape divided into discrete "cells".
