`Y = solve (eqns,vars)` solves the system of equations eqns for the variables vars and returns a structure that contains the solutions. If you do not specify vars, solve uses symvar to find the variables to solve for. In this case, the number of variables that symvar finds is equal to the number of equations eqns.

View MATLAB Command When solving a system of equations, use multiple output arguments to assign the solutions directly to output variables. The order in which the solver returns the solutions follows the order in which you specify the variables. `syms x y [sol_x, sol_y] = vpsolve ([x*sin (10*x) == y^3, y^2 == exp (-2*x/3)], [x,y])`

Vectorize the Objective Function. By default, patternsearch passes in one point at a time to the objective function. Sometimes, you can speed the solver by vectorizing the objective function to take a set of points and return a set of function values.. For the solver to evaluate a set of five points in one call to the objective function, for example, the solver calls the objective on a matrix ...
